About Termite Control

Tearing and gnawing at the wood in your home, the "silent destroyer" strikes again. Termites can infest a home and quietly and quickly cause thousands of dollars in damage before you even know they are there. At West Coast Termite Inc, we use the latest technology, methods and products to successfully treat brick, block, frame, and metal structures throughout Los Angeles and Orange County.

While termites are a fact of life in California, not all termites are equal or the same. The first step in initiating the right termite treatment is a complete inspection of the property to properly identify which type of termite is causing the problem. At West Coast Termite Inc, we provide a large variety of treatments to ensure full termite eradication. Our expert technicians will treat your property with liquid applications, creating a protective barrier over your soil and wood surfaces and preventing termites from consuming, burrowing or living around your home. And for advanced termite infestations, termite tenting is available.

Termites can destroy silently because they may be secretly hiding and growing in your home or yard without any immediate signs of damage. All termites consume cellulose-based plant materials. Unfortunately, all homes, regardless of their construction type, can provide cellulose food for termite infestation.

Subterranean termite homes are usually formed in soil. Within these mounds, termites build and grow tunnel systems and mud tunnels through which they access above-ground food sources. Drywood termites live within the wood they consume and often infest and begin to destroy walls and furniture.

Since termites can be a constant threat to your home Small steps make a big difference in termite prevention and sustaining an effective termite treatment plan. West Coast Termite can help.

Your Home

With many homeowners, their home is their biggest investment. So, of course, they get very nervous and upset when they believe termites might be invading their home.

Termite Exterminators Los Angeles:

There are "aboveground" termites called drywood termites. The drywood termites are found along the Gulf Coast, in the desert Southwest, and along the Pacific Coast, including, of course, Los Angeles and Orange County.

The most common termites, called subterranean termites, live underground. The subterranean termites attack most often and usually cause the most damage.

Every year home-owners spend millions of dollars to defend against termites and to repair the damage that they cause. Most of the expense is for treatment of subterranean termites. Residential termite control can be challenging. Termites can move through very thin cracks. This enables them to invade homes through cracks in the slab or the foundation.

Pest Control & Hard to Reach Places

Termites enter homes in hard to reach places. They have been found moving between the foundation and the brick veneer. They have also been found traveling behind stucco on the outside of a home. Termites many times enter through an expansion joint... where two slabs meet. If the termites can hide inside of a wall or beneath a carpet, they can quickly cause extensive damage before they are noticed. Residential termite control is done to prevent termites from invading. Many treatments are necessary to eliminate termites that have already attacked and invaded the home.

For termite control, West Coast Termite, Inc. usually uses Liquid termiticide to form a barrier in the soil against the termites. Depending on the home's construction, liquid termiticide can be applied into the soil beside the foundation. This might be done outside and in the crawl space. Treatment of slab homes often includes drilling holes in the concrete to protect cracks or expansion joints.

Termiticide might also be applied in areas where plumbing pipes enter the home. Some of these treatments might be made with a machine that turns the termiticide to foam. This helps the termiticide spread to the places where it is needed.

We know homeowners can help prevent termites from invading their home. A thorough inspection can quickly reveal conditions that would give termites an easy entryway.

West Coast Termite, Inc., Termite Exterminators Los Angeles, knows many homeowners call a termite control or pest control professional for a termite

inspection. During the inspection process, our experts can point out maintenance or structural issues that might make the home more attractive to termites. Correcting or changing these conditions can help prevent termites from attacking the home.

When you need the help and skills, choose West Coast Termite Inc.
